When does temporal geometry control help?

Matched controls

300 GeoTex objects
Fixed strength + stage allocation

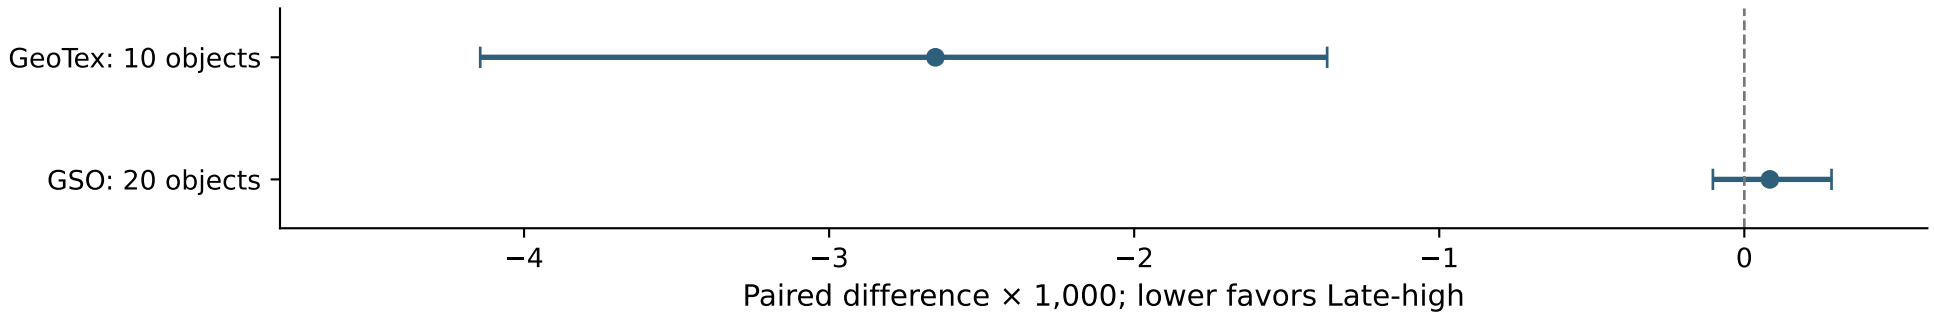
Native interface checks

50 MV-Adapter inputs + GSO100
Middle-window primary gains not detected

Actual baked meshes

10 GeoTex + 20 GSO objects
Same unseen views within each study

Late-high minus Fixed Mean on baked unseen-view foreground LPIPS



A small within-protocol benefit does not establish a universally preferred schedule.

Pointwise 95% object intervals; separate cohorts and protocols are not pooled.
